

#6669: A method like Hash#map, but returns hash

```
score = {taro: [1,3,2],  
        jiro: [3,5,8,4],  
        saburo: [2,9]}
```

```
max_score = score.apply{|k,v| [k, v.max]}  
#=> {taro: 3, jiro: 8, saburo: 9}  
p max_score[:taro]  
#=> 3
```

Hash is better than alist for handling pairs of values.
(apply ? hash_map ? map_hash ? convert ? process ?)
