

# n-depth constant lookup

[ruby-core:41404]

class names are derived as strings, but at n-depth.

```
module Foo
  module Bar
    module Baz
    end
  end
end

Foo.qualified_const_get("Bar::Baz") # => Foo::Bar::Baz
```

## Example behavior

Why add  
this feature?

**From Rails: paths translated to classes**

```
def file_name_to_class string
  string.split('/').map(&:capitalize).join '::'
end

name = file_name_to_class '/foo/bar/baz'

Object.qualified_const_get name
```

**From YAML: constants loaded as strings**

```
puts YAML.load DATA

__END__
--- !ruby/object:Foo::Bar::Baz
foo: bar
```
