

Integer(), Float()

I write this:

```
INTEGER = /^(?:[+-]?0b[0-1_]+          (?# base 2)
              |[-+]?0[0-7_]+          (?# base 8)
              |[-+]?(?:0|[1-9][0-9_]*) (?# base 10)
              |[-+]?0x[0-9a-fA-F_]+    (?# base 16))$/x

def parse_int str
  if str =~ INTEGER
    Integer(str)
  else
    str
  end
end
```

I want to write this:

```
def parse_int str
  Integer(str, exception: false) || str
end
```
