Description	
There is a common pattern in code: match = pattern.match(string) var = match && match[name_of_capture]	
One should write it everywhere not to get an exception. It can be solved by introducing something like Hash#fetch.	
<pre>class Regexp def fetch(string, capture_name:, pos: nil, default_value: nil) m = match(string, pos) m ? m[capture_name] : default_value end end</pre>
